

Half-Court Press

Creating an indoor basketball court, whether in a living room or a room all its own, requires more than high ceilings. Just as important as the backboard and net is the floor. The Paparos' great room floor is no different from one you would find in a high school gym. Maple floorboards sit on top of two layers of plywood and a half-inchthick rubber pad system for the right bounce.

To keep the noise down, the Paparos used one-inch-thick acoustic wall panels, and to prevent broken glass, but still allow for ample light, they covered the lower windows with protective structural glass.
